## **DETAILED ACTION**

### ***Response to Arguments***

1. Applicant's arguments, filed 06/28/2010, with respect to claims 1-24 have been fully considered and are persuasive. The previous rejection has been withdrawn.

### ***Allowable Subject Matter***

2. Claims 1-24 are allowed.
3. The following is an examiner's statement of reasons for allowance:

Consider independent claim 1. The prior art fails to teach or render obvious Method of locating communicating mobile objects in a communications network, in which, in the case of a communication being established between first (S) and second (A) communicating objects, the second of which (A) at least is mobile, in sites (Hi) through which the second object (A) is passing, repeaters (Fi) are generated communicating from one to the next within a chain which they form together, so as to relay to the second object (A) each message coming from the first object (S), characterised in that it further consists in: storing in each repeater (Fi) an identifier representing the location of the next repeater (F(i+1)) or site (H(i+1)) within the chain, allocating a timer (CTF) to each repeater (Fi) at the moment when this is generated, so that upon expiry of a selected duration, it addresses to at least one location server (SL) of the network the said location identifier of the next repeater (F(i+1)) or site (H(i+1)) in

order that this is stored in the server (SL) as correspondence of a primary identifier of the second object (A).

Consider independent claim 14. The prior art fails to teach or render obvious Communicating mobile object (A) for a communications network, comprising processing means (PM) capable, if a communication is set up with another communication object (S) of the said network, of generating in sites (Hi) through which it passes, repeaters (Fi) communicating from one to the next within a chain which they form together so as to relay each message coming from the other object (S) to their mobile object (A), characterised in that the processing means (PM) are contrived to allocate to each repeater (Fi), at the moment when this is generated, a timer (CTF) and to configure the repeater (Fi) so that, on the one hand, it can store an identifier representing the location of the next repeater (F(i+1)) or site (H(i+1)) within the chain, and on the other hand, so that it transmits to at least one location server (SL) of the network, upon expiry of a selected duration, the location identifier of the next repeater (F(i+1)) or site (H(i+1)) within the chain, in order that it stores these as correspondence of a primary identifier of the mobile object (A).

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
